QUESTION: A spring mass system is shown in the figure . Take the value of acceleration due to gravity as $g = 9.81 \text{ m/s}^2$. The static deflection due to weight and the time period of the oscillations, respectively, are

(GATE 2023 XE)

Solution:

- 1) Static deflection due to weight(sdw)
let x be sdw.
At mean position in equilibrium

$$Mg = kx \quad (1)$$

$$4 \cdot 9.81 = 100x \quad (2)$$

$$39.24 = 100x \quad (3)$$

$$x = 0.3924 \text{ m} \quad (4)$$

$$x = 39.24 \text{ cm} \quad (5)$$

- 2) Time period of oscillation

$$F = -kx \quad (6)$$

$$ma = -kx \quad (7)$$

$$m \left(\frac{d^2x}{dt^2} \right) = -kx \quad (8)$$

Taking Laplace transform:

$$m(s^2X(s) - sf(0) - f'(0)) = -kX(s) \quad (9)$$

$$X(s) = \frac{m(sf(0) + f'(0))}{k + ms^2} \quad (10)$$

Taking Inverse Laplace Transform:

Initial Conditions be at extreme point of SHM

$$x(t) = a \sin \left(\sqrt{\frac{k}{m}} t + \phi \right) \quad (11)$$

$$x(t) = 0.3924 \left(\sin \left(\sqrt{\frac{100}{5}} t + \frac{\pi}{2} \right) \right) \text{ m} \quad (12)$$

$$x(t) = 39.24 \sin \left(5t + \frac{\pi}{2} \right) \text{ cm} \quad (13)$$

The static deflection due to weight and the time period of the oscillations, respectively are 39.24 cm and $\frac{2\pi}{5}$ s
