**QUESTION:** Consider the equation  $\frac{dy}{dx} + ay = \sin \omega x$ , where  $a$  and  $\omega$  are constants. Given  $y = 1$  at  $x = 0$ , correct all the correct statement(s) from the following as  $x \rightarrow \infty$ .

(A)  $y \rightarrow 0$  if  $a \neq 0$

(B)  $y \rightarrow 1$  if  $a = 0$

(C)  $y \rightarrow A \exp(|a|x)$  if  $a < 0$ ;  $A$  is constant

(D)  $y \rightarrow B \sin(\omega x + C)$  if  $a > 0$ ;  $B$  and  $C$  are constants

Now as  $x \rightarrow \infty$

1)  $y \rightarrow 0$  if  $a \neq 0$  is not true as  $y$  depend on  $a, \omega$

2)  $y \rightarrow 1$  if  $a = 0$  is not true as  $y$  depend on  $\omega$

3)  $y \rightarrow A \exp(|a|x)$  if  $a < 0$  is true as  $B \sin(\omega x + C)$  is neglected compared to  $Ae^{-ax}$

4)  $y \rightarrow B \sin(\omega x + C)$  if  $a > 0$ ; is true as  $Ae^{-ax} \rightarrow 0$

$\therefore$  C,D are correct options

**Solution:** :

$$y(0) = 1 \quad (1)$$

$$\frac{dy}{dx} + ay = \sin \omega x \quad (2)$$

Taking Fourier transform on both sides

Function	Fourier transform
$\frac{dy}{dx}$	$j\omega Y$
$y$	$Y$
$\sin \omega x$	$\frac{\omega}{2j} (\delta(\omega - \omega_0) - \delta(\omega + \omega_0))$

TABLE 0

FOURIER TRANSFORM

$$j\omega Y + aY = \frac{\omega}{2j} (\delta(\omega - \omega_0) - \delta(\omega + \omega_0)) \quad (3)$$

$$\Rightarrow Y(s) = \frac{\omega}{2j(\omega + a)} (\delta(\omega - \omega_0) - \delta(\omega + \omega_0)) \quad (4)$$

Taking inverse laplace transform on both sides

$$y(x) = \frac{1}{2\pi} \int_{-\infty}^{\infty} Y(s) e^{isx} ds \quad (5)$$

$$y(x) = \frac{1}{2\pi} \int_{-\infty}^{\infty} \frac{\omega}{2i(\omega + a)} (\delta(\omega - \omega_0) - \delta(\omega + \omega_0)) e^{isx} ds \quad (6)$$

$$y(x) = \mathcal{F}^{-1}\{Y(s)\} = Ae^{-ax} + (B \cos(\omega x) + C \sin(\omega x)) \quad (7)$$

$$y(x) = \mathcal{F}^{-1}\{Y(s)\} = Ae^{-ax} + B \sin(\omega x + C) \quad (8)$$
